

AtliQ Commerce — Nightly Pipeline Timings

Seed run of 07 Oct 2026, both stages launched by scheduler. Scale column to be filled after the section 12 scale-up lab.

Stage	Started (IST)	Seed (sec)	Seed (mm:ss)	Scale (sec)	Scale (mm:ss)	Scale / Seed
ADF ingest (pl_ingest_bronze)	01:00	202	3:22			
Silver notebook (02_silver)	01:30	793	13:13			
Gold / dbt build	01:43	108	1:48			
Total compute		1,103	18:23			

Wall clock, 01:00 start to 01:45 finish2,70045:00

How to use

Fill only the yellow cells in column E, with the scale-run duration of each stage in seconds.

Example: a stage taking 24m 10s is 1450 seconds. Columns F and G calculate themselves.

Sources and assumptions

Seed figures: Databricks job run 804940364367422 (job_nightly, 07 Oct 2026), tasks silver and gold.

ADF figure: Data Factory Monitor, pipeline run of pl_ingest_bronze at 01:00 on 07 Oct 2026, triggered by tr_nightly_0100.

Total compute sums the three stage durations. It excludes the 27-minute gap between the ADF trigger (01:00) and the Databricks schedule (01:30).

Silver's 13m 13s is believed to include cluster cold start, not yet separated from compute time. Confirm before drawing conclusions from the ratio.

Scale-up target per Scale_Up_Guide.docx: 1,000,000 orders, 2,386,850 order items, 10,190,499 web event lines (about 2.9 GB).
